## #Rcpp

We will get some experience with speeding up R code using C++ via the Rcpp package.

First, clear the workspace and load the Rcpp package.

```
pacman::p_load(Rcpp)
```

Create a variable n to be 10 and a vaiable Nvec to be 100 initially. Create a random vector via rnorm Nvec times and load it into a Nvec x n dimensional matrix.

```
n <- 10
Nvec <- 100
X = matrix(data = rnorm(Nvec * n), nrow = Nvec)
head(X)</pre>
```

```

```

Write a function all\_angles that measures the angle between each of the pairs of vectors. You should measure the vector on a scale of 0 to 180 degrees with negative angles coerced to be positive.

```
angle <- function(u,v){
   acos(sum(u*v)/sqrt(sum(u^2)*sum(v^2))) * (180/pi)
}
all_angles <- function(X){
   A <- matrix(NA, nrow = nrow(X), ncol = nrow(X))
   for(i in 1:(nrow(X)-1)){
      for(j in (i+1):nrow(X)){
         A[i,j] = angle(X[i,],X[j,])
      }
   }
}</pre>
```

}			
all_	angl	es(	X

```

Plot the density of these angles.

```
pacman::p_load(ggplot2)
ggplot(data.frame(angles=c(all_angles(X)))) + aes(x=angles) + geom_density()
```

## Warning: Removed 5050 rows containing non-finite values (stat\_density).

Write an Rcpp function all\_angles\_cpp that does the same thing. Use an IDE if you want, but write it below in-line.

```
cppFunction(
   "
   NumericMatrix all_angles_cpp(NumericMatrix X){
   int n = X.nrow();
   int p = X.ncol();
   NumericMatrix A(n, n);
   std::fill(A.begin(), A.end(), NA_REAL);
   for(int i_1 = 0; i_1 < (n-1); i_1++){
      for(int i_2 = i_1 + 1; i_2 < n; i_2++){
       double sum_sqd_u = 0;
      double sum_sqd_v = 0;
      double sum_u_v = 0;
}</pre>
```

```
for(int j = 0; j < p; j++){
      sum_sqd_u += pow(X(i_1,j), 2);
      sum_sqd_v += pow(X(i_1,j), 2);
      sum_uv += X(i_1, j) * X(i_2, j);
    A(i_1,i_2) = acos(sum_u_v/sqrt(sum_sqd_u*sum_sqd_v)) * (180/M_PI);
    }
  return A;
  }
)
all_angles_cpp(X)

```

Test the time difference between these functions for n = 1000 and Nvec = 100, 500, 1000, 5000 using the package microbenchmark. Store the results in a matrix with rows representing Nvec and two columns for base R and Rcpp.

```
pacman::p_load(microbenchmark)
n <- 1000
Nvec <- c(100, 500)
time_r = c()
time_rcpp = c()
for(i in 1:length(Nvec)){
    X = c()
    for (j in 1:n){
    data = rnorm(Nvec[i])
    X = cbind(X, data)
}
time_r = c(time_r, mean(microbenchmark(all_angles(X), times=3, unit = "s")$time))
time_rcpp = c(time_rcpp, mean(microbenchmark(all_angles_cpp(X), times=3, unit = 's')$time))
}</pre>
```

Plot the divergence of performance (in log seconds) over n using a line geometry. Use two different colors for the R and CPP functions. Make sure there's a color legend on your plot. We wil see later how to create "long" matrices that make such plots easier.

```
pacman::p_load(ggplot2)
ggplot() +
  geom_line(aes(x = Nvec, y = log(time_r), col = "time_r")) +
  geom_line(aes(x = Nvec, y = log(time_rcpp), col = "time_rcpp")) +
  xlab("n") +
  ylab("seconds")
```

Let Nvec = 10000 and vary n to be 10, 100, 1000. Plot the density of angles for all three values of n on one plot using color to signify n. Make sure you have a color legend. This is not easy.

```
Nvec = 1000
X = c()
for (i in 1:10){
  data = rnorm(Nvec)
  X = cbind(X, data)
angle_1 = all_angles(X)
X = c()
for(i in 1:25){
  data = rnorm(Nvec)
  X = cbind(X, data)
angle_2 = all_angles(X)
X = c()
for (i in 1:50){
  data = rnorm(Nvec)
  X = cbind(X, data)
angle_3 = all_angles(X)
ggplot() +
  geom_density(aes(x=angle_1, fill='red'), alpha= 0.4 )+
  geom_density(aes(x=angle_2, fill='blue'), alpha= 0.4 )+
  geom_density(aes(x=angle_3, fill='green'), alpha= 0.4 )+
  scale_fill_discrete(c('n = 10', 'n=100', 'n=1000'))
```

```
## Warning: Removed 500500 rows containing non-finite values (stat_density).
```

## Warning: Removed 500500 rows containing non-finite values (stat\_density).

Write an R function nth\_fibonnaci that finds the nth Fibonnaci number via recursion but allows you to specify the starting number. For instance, if the sequency started at 1, you get the familiar 1, 1, 2, 3, 5, etc. But if it started at 0.01, you would get 0.01, 0.01, 0.02, 0.03, 0.05, etc.

```
nth_fibonnaci = function(n, start){
  if(n == 1| n==2) return(start)
  else return(nth_fibonnaci(n-1, start) + nth_fibonnaci(n-2, start))
}
```

Write an Rcpp function nth\_fibonnaci\_cpp that does the same thing. Use an IDE if ou want, but write it below in-line.

```
cppFunction(
  'double nth_fibonacci_cpp(int n, double start){
  if(n==1||n==2)
  return start;
  return(nth_fibonacci_cpp(n-1, start)+ nth_fibonacci_cpp(n-2, start));
  }'
)
```

Time the difference in these functions for  $n = 100, 200, \ldots, 1500$  while starting the sequence at the smallest possible floating point value in R. Store the results in a matrix.

```
n = 10
time_r = c()
time_rcpp = c()
for (i in 1:n){
   time_r = c(time_r, mean(microbenchmark(nth_fibonnaci(i, .Machine$double.xmin), times=3, unit = "s")$t
time_rcpp = c(time_rcpp, mean(microbenchmark(nth_fibonnacci_cpp(i, .Machine$double.xmin), times=3, unit = "s")$t
}
```

Plot the divergence of performance (in log seconds) over n using a line geometry. Use two different colors for the R and CPP functions. Make sure there's a color legend on your plot.

```
pacman::p_load(ggplot2)
ggplot() +
  geom_line(aes(x = 1:n, y = log(time_r), col = "time_r")) +
  geom_line(aes(x = 1:n, y = log(time_rcpp), col = "time_rcpp")) +
  xlab("Fibonacci") +
  ylab("seconds")
```

## Data Wrangling / Munging / Carpentry

Throughout this assignment you can use either the tidyverse package suite or data.table to answer but not base R. You can mix data.table with magrittr piping if you wish but don't go back and forth between tbl\_df's and data.table objects.

```
pacman::p_load(dplyr, magrittr, data.table)
```

Load the storms dataset from the dplyr package and investigate it using str and summary and head. Which two columns should be converted to type factor? Do so below.

```
data(storms)
str(storms)
## tibble[,13] [10,010 x 13] (S3: tbl_df/tbl/data.frame)

For each named storm, find its maximum category, wind speed, pressure and diameters. Do not allow the max to be NA (unless all the measurements for that storm were NA).

## # A tibble: 54 x 6

For each year in the dataset, tally the number of storms. "Tally" is a fancy word for "count the number of". Plot the number of storms by year. Any pattern?

```
storms %>%
  group_by(year) %>%
  summarize(n()) %>%
  plot()
```

For each year in the dataset, tally the storms by category.

##

1 1975 -1

```
storms %>%
group_by(year, category) %>%
summarize (n_distinct(name))
```

2

```

```

Convert year, month, day, hour into the variable timestamp using the lubridate package. Although the new package clock just came out, lubridate still seems to be standard. Next year I'll probably switch the class to be using clock.

```
pacman::p_load(lubridate)
storms%>%
  mutate(timestamp = make_datetime(year, month, day, hour))%>%
  select(timestamp, everything())
```

## # A tibble: 10,010 x 14

## 7 5
               5
                               145.
                                               916.
                                                                 317.
                                                                                 120.
```

For each named storm, find its maximum category, wind speed, pressure and diameters (do not allow the max to be NA) and the number of readings (i.e. observations).

Calculate the distance from each storm observation to Miami in a new variable distance\_to\_miami. This is very challenging. You will need a function that computes distances from two sets of latitude / longitude coordinates.

```
MIAMI_LAT_LONG_COORDS = c(25.7617, -80.1918)
```

For each storm observation, use the function from the previous question to calculate the distance it moved since the previous observation.

For each storm, find the total distance it moved over its observations and its total displacement. "Distance" is a scalar quantity that refers to "how much ground an object has covered" during its motion. "Displacement" is a vector quantity that refers to "how far out of place an object is"; it is the object's overall change in position.

For each storm observation, calculate the average speed the storm moved in location.

```
#TO-DO
```

For each storm, calculate its average ground speed (how fast its eye is moving which is different from windspeed around the eye).

Is there a relationship between average ground speed and maximum category attained? Use a dataframe summary (not a regression).

```
#T0-D0
```

Now we want to transition to building real design matrices for prediction. This is more in tune with what happens in the real world. Large data dump and you convert it into X and y how you see fit.

Suppose we wish to predict the following: given the first three readings of a storm, can you predict its maximum wind speed? Identify the y and identify which features you need  $x_1, ... x_p$  and build that matrix with **dplyr** functions. This is not easy, but it is what it's all about. Feel free to "featurize" as creatively as you would like. You aren't going to overfit if you only build a few features relative to the total 198 storms.

Fit your model. Validate it.

```
#T0-D0
```

Assess your level of success at this endeavor.

#TO-DO

## The Forward Stepwise Procedure for Probability Estimation Models

Set a seed and load the adult dataset and remove missingness and randomize the order.

```
set.seed(1)
pacman::p_load_gh("coatless/ucidata")
data(adult)
adult = na.omit(adult)
adult = adult[sample(1 : nrow(adult)), ]
```

Copy from the previous lab all cleanups you did to this dataset.

We will be doing model selection. We will split the dataset into 3 distinct subsets. Set the size of our splits here. For simplicitiy, all three splits will be identically sized. We are making it small so the stepwise algorithm can compute quickly. If you have a faster machine, feel free to increase this.

```
Nsplitsize = 1000
```

Now create the following variables: Xtrain, ytrain, Xselect, yselect, Xtest, ytest with Nsplitsize observations. Binarize the y values.

```
Xtrain = adult[1 : Nsplitsize, ]
Xtrain$income = NULL
ytrain = ifelse(adult[1 : Nsplitsize, "income"] == ">50K", 1, 0)
Xselect = adult[(Nsplitsize + 1) : (2 * Nsplitsize), ]
Xselect$income = NULL
yselect = ifelse(adult[(Nsplitsize + 1) : (2 * Nsplitsize), "income"] == ">50K", 1, 0)
Xtest = adult[(2 * Nsplitsize + 1) : (3 * Nsplitsize), ]
Xtest$income = NULL
ytest = ifelse(adult[(2 * Nsplitsize + 1) : (3 * Nsplitsize), "income"] == ">50K", 1, 0)
```

Fit a vanilla logistic regression on the training set.

```
logistic_mod = glm(ytrain ~ ., Xtrain, family = "binomial")
```

## Warning: glm.fit: fitted probabilities numerically 0 or 1 occurred and report the log scoring rule, the Brier scoring rule.

```
p = predict(logistic_mod, Xtrain, type = "response")

## Warning in predict.lm(object, newdata, se.fit, scale = 1, type = if (type == :
## prediction from a rank-deficient fit may be misleading

mean(ytrain*log(p)+(1-ytrain) * log(1- p))

## [1] -0.2652391

mean(-(ytrain - p)^2)
```

## ## [1] -0.08531854

We will be doing model selection using a basis of linear features consisting of all first-order interactions of the 14 raw features (this will include square terms as squares are interactions with oneself).

Create a model matrix from the training data containing all these features. Make sure it has an intercept column too (the one vector is usually an important feature). Cast it as a data frame so we can use it more easily for modeling later on. We're going to need those model matrices (as data frames) for both the select and test sets. So make them here too (copy-paste). Make sure their dimensions are sensible.

```
Xmm_train = data.frame(model.matrix(~.,Xtrain))
Xmm_select = data.frame(model.matrix(~.,Xselect))
Xmm_test = data.frame(model.matrix(~.,Xtest))
dim(Xmm_train)
## [1] 1000 98
dim(Xmm_select)
## [1] 1000 98
```

## [1] 1000 98

Write code that will fit a model stepwise. You can refer to the chunk in the practice lecture. Use the negative Brier score to do the selection. The negative of the Brier score is always positive and lower means better making this metric kind of like s\_e so the picture will be the same as the canonical U-shape for oos performance.

Run the code and hit "stop" when you begin to the see the Brier score degrade appreciably oos. Be patient as it will wobble.

```
pacman::p_load(Matrix)
p_plus_one = ncol(Xmm_train)
predictor_by_iteration = c()  #keep a growing list of predictors by iteration
in_sample_brier_by_iteration = c()  #keep a growing list of briers by iteration
oos_brier_by_iteration = c()  #keep a growing list of briers by iteration
i = 1

repeat {
    #TO-DO
    #wrap glm and predict calls with use suppressWarnings() so the console is clean during run
if (i > Nsplitsize || i > p_plus_one){
    break
}
```

Plot the in-sample and oos (select set) Brier score by p. Does this look like what's expected?
